POSITIVE ELECTRODE ACTIVE MATERIAL, FOR ALKALINE STORAGE BATTERY, POSITIVE ELECTRODE USING THE SAME AND METHOD OF PRODUCING THE SAME

Examiner: Yuan

S.N. 10/081,087

Art Unit: 1745

August 15, 2005

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on July 7, 2005 has been entered. Claims 1 and 8 were amended.

2. The text of those sections of Title 35, U.S.C. code not included in this action can be found in the prior Office Action on January 10, 2005.

Claim Rejections - 35 USC § 102/103

3. Claims 1-4,6-8 are rejected under 35 U.S.C.102(e) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Hayashi et al. (US 6,358,648 B2).

With respect to claims 1,3,4,6,7, Hayashi et al. teach a nickel electrode active material for alkaline storage batteries comprising nickel hydroxide. Nickel hydroxide is produced by mixing and stirring an aqueous nickel sulfate solution and an aqueous sodium hydroxide solution thereby depositing nickel hydroxide. The powders are then subjected to alkali treatment with one of aqueous sodium hydroxide solutions having different pH values (alkali treatment) to

Art Unit: 1745

remove anions such as sulfate. Spherical powders, i.e., mean particle circularity is equivalent to 1, of solid solute nickel hydroxide incorporating therein one or two elements selected from the group consisting of cobalt, cadmium, zinc and magnesium are produced. The mean particle size of the resulting power is reported to be about 10 \(\sigma\)m. Hayashi et al. further teach that the resulting nickel hydroxide particles have better crystal growth and more homogeneous crystal along certain crystal plane than conventional nickel hydroxide. As a result, the decreases in the number of disordered crystals suggest uniform progress of charge reaction of nickel hydroxide to nickel oxyhydroxide. Thus, the positive electrode active material would invariably comprise nickel oxyhydroxide upon charging the battery. See Abstract, Column 3, Lines 51-67; Column 4, Lines 39-51; Column 6, Lines 39-46. Moreover, it is the position of the examiner that other properties of said material, such as BET surface area, particle size distribution and full width at half maximum of a particular crystallographic orientation, are inherent, given that the positive electrode active material disclosed by Hayashi et al. and the present application having same chemistry and manufacturing procedures. A reference which is silent about a claimed invention's features is inherently anticipatory if the missing feature is necessarily present in that which is described in the reference. Inherency is not established by probabilities or possibilities. In re Robertson, 49 USPQ2d 1949 (1999).

Alternatively, Hayashi et al. have identified pH and mixing (stirring) of the solution as the processing variables in the fabrication of positive electrode active material. See Example 1. Therefore, it would have been within the skill of the ordinary artisan to adjust the pH and the degree of mixing of the solution to yield nickel hydroxide or nickel oxyhydroxide powders of

Application/Control Number: 10/081,087

Art Unit: 1745

desired circularity and distribution of circularity. Discovery of optimum value of result effective variable in known process is ordinarily within skill of art. In re Boesch, CCPA 1980, 617 F.2d 272, 205 USPQ215.

Page 3 of 6

With respect to claim 2, Hayashi et al. teach the solid solution nickel hydroxide powders are produced by dissolving a sulfate of one or two elements, including cobalt, cadmium, zinc and magnesium, in the nickel sulfate solution. Therefore, the resulting positive electrode active material would have a cobalt compound on a portion of the surface. See Column 6, Lines 37-46.

With respect to claim 8, Hayashi et al. teach the positive electrode active material is first mixed with a cobalt powder, a cobalt hydroxide powder and a zinc oxide powder. Water is then added to the mixture and kneaded to make a paste, which is filled onto a foamed porous nickel substrate. See Column 5, Lines 11-20.

4. Claims 1-4,6-8 are rejected under 35 U.S.C.102(e) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Kato et al. (US 6,083,642).

With respect to claims, 1-4,6,7, Kato et al. disclose a positive electrode material for an alkaline storage battery. The active material comprises nickel hydroxide particles and a higher cobalt oxide (γ-cobalt oxyhydroxide). The positive electrode material is prepared by coating the surface of nickel hydroxide particles with the higher cobalt oxide. The nickel hydroxide particles are a solid solution material with one or more metallic element other than nickel, including cobalt, cadmium, and zinc. The solid solution nickel hydroxide particles with the cobalt oxide coating have an average particle diameter of 5 to 20 μm and a BET specific surface

Art Unit: 1745

area of 5 to 12 m²/g. In one embodiment, an aqueous solution containing nickel sulfate as the main component and cobalt sulfate and zinc sulfate are mixed. An aqueous sodium hydroxide solution is slowly added dropwise while adjusting the pH of the solution with aqueous ammonia, thereby to deposit spherical solid solution nickel hydroxide particles, i.e., the circularity of the particles is 1. The solid solution nickel hydroxide particles with Co and Zn incorporated therein thus prepared are washed with water and then dried to obtained positive electrode particles. Also, Kato et al. reveal the presence of nickel oxyhydroxide in the positive electrode active material based on the X-ray diffraction and the spectral calorimeter studies. See Abstract, Column 4, Lines 22-42; 66 to Column 5, Line 5; Column 11, Lines 50-65; Column 6, Lines 39-46; Column 13, Lines 26-45; Column 29, Lines 1-12. Moreover, it is the position of the examiner that other properties of said material, such as particle size distribution and full width at half maximum of a particular crystallographic orientation, are inherent, given that the positive electrode active material disclosed by Kato et al. and the present application having same chemistry and manufacturing procedures. A reference which is silent about a claimed invention's features is inherently anticipatory if the missing feature is necessarily present in that which is described in the reference. Inherency is not established by probabilities or possibilities. In re Robertson, 49 USPQ2d 1949 (1999).

Alternatively, Kato references have identified pH and temperature of the solution as critical processing variables in the fabrication of positive electrode active material. See Column 2, Lines 15-45. Therefore, it would have been within the skill of the ordinary artisan to adjust the pH and temperature of the solution to yield nickel hydroxide or nickel oxyhydroxide powders

of desired circularity and distribution of circularity. Discovery of optimum value of result effective variable in known process is ordinarily within skill of art. In re Boesch, CCPA 1980, 617 F.2d 272, 205 USPQ215.

With respect to claim 8, Kato et al. teach the positive electrode active material is first mixed with a cobalt powder, a cobalt hydroxide powder and a zinc oxide powder. Water is then added to the mixture and kneaded to make a paste, which is filled onto a foamed porous nickel substrate. See Column 11, Line 66 to Column 12, Line 10.

Response to Arguments

5. Applicant's arguments filed on July 7, 2005 have been fully considered but they are not persuasive.

Applicant's principle arguments are

Kato and Hayashi do not teach or suggest that the particle circularity of the active material is greater than 0.95 and less than 1 as determined by a particle image analysis with a flat sheath flow utilizing hydrodynamics.

In response to Applicant's arguments, please consider the following comments.

It is the position of the Examiner that properties of said nickel hydroxide powder, such as BET surface area, particle size distribution and full width at half maximum of a particular crystallographic orientation, are inherent, given that the positive electrode active material disclosed by Hayashi, Kato and the present application having same chemistry and

Application/Control Number: 10/081,087

Art Unit: 1745

manufacturing procedures. The measurement of circularity of the powders should not be

distinctive by how the measurements are made or where the measurements are performed. The

Page 6 of 6

fact that the circularity in the instant disclosure is determined by a particle image analysis with a

flat sheath flow utilizing hydrodynamics would not provide patentable distinction over the prior

art.

Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Dah-Wei D. Yuan whose telephone number is (571) 272-1295.

The examiner can normally be reached on Monday-Friday (8:00-5:00).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Patrick J. Ryan, can be reached on (571) 272-1292. The fax phone number for the

organization where this application or proceeding is assigned is (703) 872-9306.

Information regarding the status of an application may be obtained from the Patent

Application Information Retrieval (PAIR) system. Status information for published applications

may be obtained from either Private PAIR or Public PAIR. Status information for unpublished

applications is available through Private PAIR only. For more information about the PAIR

system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR

system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
